

Marrying the Trench Panel and the Sand Panel

Both panels have similar spacing and engineering attributes. The Sand Panel is engineered with a 1.5 safety factor to 15 feet of depth. It is lighter and of a slightly different design than the Trench Panel. They can be used together, but not without thought! If there is a lack of available Trench Panels, then sand panels can be used to complete the walls. Use Trench Panels for the “bottom” of the trench and stack the Sand Panels on top per table “M”.
